Title of Project : Discovering Social Networks Through Web 2.0

Name of Supervisor : KAN Min-Yen

Contact Details: kanmy@comp.nus.edu.sg

Short Description

Much of Web 2.0 revolves around User Generated Content. To build useful models of social networks requires that we aggregate information across different websites about the same person. In this thesis work, we will examine issues of record linkage and matching, user generated content extraction, knowledge base population and social network analysis by building the social network through Web 2.0 crawls. Note: the starting project for the first year may be related but substantially different from this project.
